7 MathematicsTheory

7.1 Mobius Inversions

- $\phi \circ I = $ id i.e. $\sum_{d|n} \phi(d) = n$. Hence, $\phi = \mu \circ $ id i.e. $\phi(d) = \sum_{d|n} \mu(d) \frac{n}{d}$

- Count of numbers coprime to n and lesser than $n = phi(n)$
  Sum of numbers coprime to n and lesser than n is $\frac{n}{2}\phi(n)$
  Proved using the fact that if x is coprime to n then so is $n - x$ coprime to n. Sum over both and take average

- $\sum_{d|n}\mu(d)f(d) = \prod_{p|n}(1 - f(p))$ (p are its prime factors)

- $\sum_{d|n}\mu^2(d)f(d) = \prod_{p|n}(1 + f(p))$

- $\phi(mn) = \frac{\phi(m)\phi(n)\gcd(m,n)}{\phi(\gcd(m,n))}$

- $\phi(p^a) = p^{a-1}\phi(p)$

7.2   Chinese Remainder Theorem

System $x \equiv a_i(\mod m_i)$ for $i = 1,\ldots,n$, with pairwise relatively prime m_i has a unique solution modulo $M = \prod m_i$ $x = \sum_i a_i b_i \frac{M}{m_i}(\mod M)$ where b_i is modular inverse of $\frac{M}{m_i}$ modulo m_i.

System $x \equiv a(\mod m)$, $x \equiv b(\mod n)$ has solutions iff $a \equiv b(\mod g)$, where $g = \gcd(m,n)$. The solution is unique modulo $L = \frac{mn}{g}$, and equals: $x \equiv a + T(ba)m/g \equiv b + S(ab)n/g(\mod L)$, where S and T are integer solutions of $mT + nS = \gcd(m,n)$.

Euler's theorem: $a^{\phi(n)} \equiv 1(\mod n)$, if $\gcd(a,n) = 1$ Wilson's theorem: p is prime iff $(p-1)! \equiv -1(\mod p)$ Primitive Pythagorean triple generator: $(m^2 - n^2)^2 + (2mn)^2 = (m^2 + n^2)^2$ Postage stamps/McNuggets problem: Let a, b be coprime integers. There are exactly $\frac{1}{2}(a1)(b1)$ numbers not of form $ax + by(x, y \geq 0)$, and the largest is $(a1)(b1)1 = abab$.

Fermat's two-squares theorem: Odd prime p can be represented as a sum of two squares iff $p \equiv 1(\mod 4)$. A product of two sums of two squares is a sum of two squares. Thus, n is a sum of two squares iff every prime of form $p = 4k + 3$ occurs an even number of times in n's factorization.

Counting Primes Fast: To count number of primes lesser than big n. Use following recurrence. $\mathrm{dp}[n][j] = \mathrm{dp}[n][j+1] + \mathrm{dp}[n/p_j][j]$ where $dp[i][j]$ stores count of numbers lesser than equal to i having all prime divisors greater than equal to p_j. Precompute this for all i less than some small k and for others use the recurrence to compute in small time.

Compute $P_N(x)$ in $T(n) = T(n/2) + \mathcal{O}(n\log n) \approx \mathcal{O}(n\log n)$ $P_{2N}(x) = P_N(x)P_N(x + N)$. using polynomial shifting. Say, $P_N(x) = \prod_{i=1}^{N}(x + i) = \sum_{i=0}^{N}c_i.x^i$. Then, $P_N(x + N) = \sum_{i=0}^{N}h_i.x^i$, where, $h_i = \frac{1}{i!}.$(coefficient of $x^{N-i} in A(x)B(x)$) where, $A(x) = \sum_{i=0}^{N}(c_{N-i}.(N - i)!).x^i$, and $B(x) = \sum_{i=0}^{N}\left(\frac{N^i}{i!}\right).x^i$

```
MUL(N) // computes (x+1)(x+2)...(x+N) in O(NlogN)
    if N==1:
        return (x+1)
    C = MUL(N/2)
    H = convolute(A,B) // use C to obtain A
    ANS = convolute(C,H)
    if N is odd:
        ANS *= (x+N) // naive multiplication will do - O(N)
    return ANS
```

8   MatrixTools
